Discussion:

Wide spread rainfall occurred over most of the IFloodS domain. The total accumulations were less than an inch but some areas in Central Iowa, at the outskirts of the NPOL's range reported totals of 2 inches and more.

Many of Iowa's streams and rivers still are running close to bank full near the minor flood levels.

CSU and IFC team are working jointly on developing NEXRAD polarimetric data based high resolution rainfall product for the IFloodS domain.
